Scientific Reproducibility, Biosecurity and the 3Rs – Determining How to acquire animal models

The global COVID-19 pandemic and its resulting implications have meant that research institutes have been re-evaluating how to best manage animal colonies. For both researchers and facility teams, two common questions have arisen – when does it make sense to breed models in-house, and when is it best to obtain them from a qualified vendor?

Join us as we cover the main considerations including:

- Reproducibility, breeding and genetic integrity
- Biosecurity and animal health best practice
- Generating just the animals you need and the 3Rs
- Opportunity costs and best utilization of resources
- Submitting publications and the ARRIVE guidelines 2.0

Speaker: Urte Jaeh, EU Scientific Support Manager
Research Models and Services, Charles River
